

Turn your GitHub profile into an animated portfolio

A video of you waving, a hobbies carousel, an orbiting tech stack, a holographic ID badge and a 3D city built from your commits — all pure SVG, generated by AI from the prompts on page 2.

WHAT YOU GET

- **Video hero** — your own clip plays inside the README, framed like a camera viewfinder
- **Two panels** — what you build, plus a carousel of hobbies with story-style progress bars
- **Tech orbit** — real brand icons circling an atom core
- **ID badge + dashboard** — swinging holographic card, live stats, project bar chart
- **3D contribution city** — commits become a night skyline, rebuilt daily
- **Connect footer** — your character pointing at your links

WHAT YOU NEED

- A GitHub account (free)
- An AI image generator for your character art
- An AI assistant that can write and test SVG files (e.g. Claude)
- A 2-second selfie video (optional but it is the best part)
- About 20 minutes

Why SVG? GitHub strips JavaScript from READMEs, so SVG + CSS/SMIL is the only motion that survives — and it needs zero libraries.

STEP 1 • Record a 2-second clip

Film yourself walking in and waving, 2 seconds max, against a plain dark wall. Keep it short — every frame is embedded in the file. No video? Skip to Step 2 and use a still portrait instead.

STEP 2 • Generate your character art

Ask any AI image tool for these two images. Edit the bracketed parts to look like you.

IMAGE PROMPT A (portrait for the ID badge)

Anime-style digital illustration of a [young developer, long dark hair, sunglasses on head], wearing a [white zip hoodie over a yellow tee], holding an open laptop, smiling warmly at the viewer, upper body, front facing, clean line art, vibrant colors, **transparent background**, high resolution.

IMAGE PROMPT B (pointing pose for the footer)

Same character, full body, winking and smiling, pointing to the side with one hand, next to a glowing neon handwritten sign that reads "[yourhandle]", sparkles and small hearts, sticker-style outline, **transparent background**, high resolution.

STEP 3 • Create the magic repository

On GitHub create a **new public repository** named **exactly like your username** (username/username) and tick "Add a README file". GitHub will show a "You found a secret!" hint — that repo renders on your profile.

HOW THE PAGE STACKS UP

1 • HERO — your video + name + cycling roles

2 • WHAT I BUILD

3 • HOBBIES CAROUSEL

4 • TECH ORBIT + chip grid

5 • ID BADGE + DASHBOARD (stats, bar chart, now)

6 • PROJECTS TABLE + 3D CONTRIBUTION CITY

7 • CONNECT FOOTER — character + link cards

STEP 4 • Paste this into your AI assistant

Attach your two images (and the video, if you filmed one), then paste the prompt below and replace everything in [brackets].

Here are my character images [+ a 2-second video of me waving]. Build a complete animated GitHub profile README as self-contained SVG files. My details: name [NAME], role [ROLE], GitHub [USERNAME], email [EMAIL], location [CITY], company [COMPANY], skills [SKILLS], hobbies [HOBBIES].

Style: dark "midnight glass" cards (#0d0e16 background) with an aurora accent ramp — cyan #22d3ee, violet #a78bfa, pink #f472b6. Embed a display font and a mono font as base64 woff2 so typography is identical everywhere. Every card: rounded corners, subtle dot texture, gradient hairline border.

Build these files:

1. **hero.svg** — extract every frame of my video, embed them as base64 JPEGs and switch them with SMIL so the clip plays inside the SVG on a short loop (about 4s: play once, hold the last frame ~1.4s, fade, repeat). Mask the video edges so it melts into the background. Frame it like a camera viewfinder: corner brackets that draw in, a blinking REC dot, a filename label and a scrubber bar synced to the loop. On the left: an "open to collabs" pill with a pulsing dot, a typed "Hi there, I'm", my name in a big animated gradient revealed by a rising mask, cycling role lines, a one-line pitch and a meta row (location, company, stars/repos) with small drawn icons.
2. **about-life.svg** — two cards side by side. Left: an illustration inside a fake browser window with a URL bar and blinking cursor, plus three capability rows with icon tiles. Right: a carousel of my hobbies that slides and crossfades every 4s with Instagram-style segment progress bars, a caption per slide, and three "daily rings" that fill on loop.
3. **stack.svg** — tech icons from the Simple Icons set riding three tilted elliptical orbits around a glowing core, plus a grouped chip grid (Frontend / Motion & 3D / Data / AI) where chip borders glow one after another. Make [two tools] small moons that orbit the [React] icon while it travels its own orbit, and keep enough clearance that the moons never overlap the core.
4. **id-dashboard.svg** — a lanyard ID badge that drops in and swings with damped pendulum physics: strap with printed text, metal clasp, my portrait in a frame with a light travelling around it, gold chip, barcode, holographic foil sweep. Beside it a dashboard: KPI tiles whose numbers count up, a single-hue bar chart of my most-starred repos with values labelled, and a "now" panel.
5. **connect.svg** — my pointing character on the left, link cards on the right with brand icons and nudging arrows.
6. **README.md** wiring it all together, a projects table, and a workflow using yoshi389111/github-profile-3d-contrib so my contributions render as a 3D night-view city, refreshed daily.

Rules that keep it working: only CSS + SMIL animation (GitHub strips JS); nothing loaded from the network — inline every font and image as base64 (PNG, not WebP); give entrance animations *fill-mode both* and start SMIL timelines at 0s with keyTimes for delays, so a renderer that ignores animation still shows the finished card; namespace ids when embedding other SVGs; add ?v=1 cache-busting to every image link in the README; then render each file in a browser at several timestamps and check it before handing it over.

STEP 5 • Upload

- Put the SVGs + README.md in the repo root
- Put the workflow in .github/workflows/
- Commit — your profile updates instantly

STEP 6 • Switch on the city

- Open the **Actions** tab, enable workflows
- Run the 3D contribution workflow once (~1 min)
- It then refreshes itself every day

The one trick everyone misses: GitHub caches README images hard. If you edit an SVG and "nothing changes", the file is fine — the cache is stale. Bump the version in the README link (hero.svg?v=1 → ?v=2), commit, then hard-refresh. Commit the SVG first, the README second.

POLISH

- Screen-record the hero booting up — it makes a great reel
- Ask for a light-mode copy of the hero and switch with a <picture> tag on prefers-color-scheme
- Numbers baked into the SVG are static — ask the AI to refresh them when your stats grow
- Iterate freely: "make the loop faster", "move that card left", "add a scanner line"

Built with AI in about 20 minutes. If this helped, pass it on. — keep coding, keep growing.
